Service Brief Part Number 64671-90901
Microfiche Part Number 64671-90801

PRINTED: DECEMBER 1983

CERTIFICATION

Hewlett-Packard Company certifies that this product met its published specifications at the time of shipment from the factory. Hewlett-Packard further certifies that its calibration measurements are traceable to the United States National Bureau of Standards, to the extent allowed by the Bureau's calibration facility, and to the calibration facilities of other International Standards Organization members.

WARRANTY

This Hewlett-Packard system product is warranted against defects in materials and workmanship for a period of 90 days from date of installation. During the warranty period, HP will, at its options, either repair or replace products which prove to be defective.

Warranty service of this product will be performed at Buyer's facility at no charge within HP service travel areas. Outside HP service travel areas, warranty service will be performed at Buyer's facility only upon HP's prior agreement and Buyer shall pay HP's round trip travel expenses. In all other cases, products must be returned to a service facility designated by HP.

For products returned to HP for warranty service. Buyer shall prepay shipping charges to HP and HP shall pay shipping charges to return the product to Buyer. However, Buyer shall pay all shipping charges, duties, and taxes for products returned to HP from another country.

HP warrants that its software and firmware designated by HP for use with an instrument will execute its programming instructions when properly installed on that instrument. HP does not warrant that the operation of the instrument, or software, or firmware will be uninterrupted or error free.

LIMITATION OF WARRANTY

The foregoing warranty shall not apply to defects resulting from improper or inadequate maintenance by Buyer, Buyer-supplied software or interfacing, unauthorized modification or misuse, operation outside of the environmental specifications for the product, or improper site preparation or maintenance.

NO OTHER WARRANTY IS EXPRESSED OR IMPLIED. HP SPECIFICALLY DISCLAIMS THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE.

EXCLUSIVE REMEDIES

THE REMEDIES PROVIDED HEREIN ARE BUYER'S SOLE AND EXCLUSIVE REMEDIES. HP SHALL NOT BE LIABLE FOR ANY DIRECT, INDIRECT, SPECIAL, INCIDENTAL, OR CONSEQUENTIAL DAMAGES, WHETHER BASED ON CONTRACT, TORT, OR ANY OTHER LEGAL THEORY.

ASSISTANCE

Product maintenance agreements and other customer assistance agreements are available for Hewlett-Packard products.

For any assistance, contact your nearest Hewlett-Packard Sales and Service Office.

SAFETY SUMMARY

The following general safety precautions must be observed during all phases of operation, service, and repair of this instrument. Failure to comply with these precautions or with specific warnings elsewhere in this manual violates safety standards of design, manufacture, and intended use of the instrument. Hewlett-Packard Company assumes no liability for the customer's failure to comply with these requirements.

GROUND THE INSTRUMENT.

To minimize shock hazard, the instrument chassis and cabinet must be connected to an electrical ground. The instrument is equipped with a three-conductor ac power cable. The power cable must either be plugged into an approved three-contact electrical outlet or used with a three-contact to two-contact adapter with the grounding wire (green) firmly connected to an electrical ground (safety ground) at the power outlet. The power jack and mating plug of the power cable meet International Electrotechnical Commission (IEC) safety standards.

DO NOT OPERATE IN AN EXPLOSIVE ATMOSPHERE.

Do not operate the instrument in the presence of flammable gases or fumes. Operation of any electrical instrument in such an environment constitutes a definite safety hazard.

KEEP AWAY FROM LIVE CIRCUITS.

Operating personnel must not remove instrument covers. Component replacement and internal adjustments must be made by qualified maintenance personnel. Do not replace components with power cable connected. Under certain conditions, dangerous voltages may exist even with the power cable removed. To avoid injuries, always disconnect power and discharge circuits before touching them.

DO NOT SERVICE OR ADJUST ALONE.

Do not attempt internal service or adjustment unless another person, capable of rendering first aid and resuscitation, is present.

DO NOT SUBSTITUTE PARTS OR MODIFY INSTRUMENT.

Because of the danger of introducing additional hazards, do not install substitute parts or perform any unauthorized modification of the instrument. Return the instrument to a Hewlett-Packard Sales and Service Office for service and repair to ensure that safety features are maintained.

DANGEROUS PROCEDURE WARNINGS.

Warnings, such as the example below, precede potentially dangerous procedures throughout this manual. Instructions contained in the warnings must be followed.

WARNING

**Dangerous voltages, capable of causing death, are present in this instrument.
Use extreme caution when handling, testing, and adjusting.**

Service -- Model 64671A

Figure 1. Model 64671A Interface Module

GENERAL INFORMATION.

The Model 64671A Processor Interface, along with the 64620S (with the 64650A General Purpose Preprocessor) or with the 1630A/D/W (with the 10269A General Purpose Preprocessor), connects the signals from the 6809/6809E Processor to the state analyzer generating all status and clock signals required for inverse assembly of the 6809/6809E instruction set. Status is generated on the interface module to indicate opcode fetches. These signals are used by the inverse assembler to provide a decoded listing of the data bus. The CPU can operate at clock rates up to 2 MHz.

INTERFACE DESCRIPTION.

The primary function of the interface module is to connect the target processor, thru the preprocessor, to the state analyzer in such a way that the address, data, and the status are available for the state analyzer to use. The 64671A makes this possible by means of a state machine on the interface module. The state machine takes the information on the data bus of the 6809/6809E Target System and generates 5 bits of status for the state analyzer.

The data bus signals from the processor are buffered and latched before they are sent to the state analyzer and to the state machine on the interface module. The state machine on the 64671A Interface Module consists of three PROMs that interperate the data to generate the status.

CIRCUIT DESCRIPTION.

The circuitry on the 64671A Interface board is divided into three groups: 1) LATCHES, 2) TIMING/CONTROL, and 3) STATE MACHINE. Each group is explained in this section.

CPU BUS LATCHES. There are six 74LS574 octal flip-flops that are the front end of the interface module. They are U1B, U1C, U1D, U1H, U2C, and U3B. These devices capture address, data, and status information at the end of every 6809 bus cycle. Information is sampled on the falling edge of the 6809/6809E "E" clock signal. The "E" clock is buffered and inverted by U3C before going to the flipflops.

TIMING AND CONTROL LOGIC. The control logic section receives the "E and Q" clocks, R/W (Read/low Write), BS (Bus Status), and BA (Bus Available) input signals from the microprocessor. These signals control the State Machine U2F, U2G, U2H. They also clock and generate status signals for the state analyzer. Each signal is described in the next five paragraphs.

The PCLOCK signal is the clock for the state machine. It runs at the same frequency as the "E" or "Q" clock, but it is active only during cycles when the processor is executing instructions. The PCLOCK signal is generated by U2D.

The LCLEAR signal initializes the state machine each time the 6809/6809E reads an interrupt or reset vector (BA=0 and BS=1), or when the 6809/6809E performs a data write. The next read the processor makes from other than address FFFFH will be an opcode fetch.

The HINT signal indicates that the current instruction that the 6809/6809E is fetching will be aborted due to a hardware interrupt. During the second cycle of any instruction, the 6809/6809E will perform a memory read from the location following where the opcode was read. The only time this will not occur is if the processor is going to abort the instruction because of a hardware interrupt.

By monitoring the lowest address line (A0) from the 6809/6809E and comparing it to A0 from the previous processor bus cycle, the interrupt can be detected. If they are both high or both low, the instruction is being interrupted. U2D makes this comparison at each bus cycle.

The STAT7 signal indicates that the current bus cycle is useful for instruction analysis. There are two types of bus cycles that are qualified out in the generation of this signal. The first is when the BA and BS lines indicate that the processor is in the sync acknowledge or halt/bus grant mode. The second is when the state machine indicates that the current bus cycle is not useful. This line is used as both a status line and as CLOCK0 to the state analyzer.

STATE MACHINE. The purpose of the state machine is to track the bus cycles performed by the 6809/6809E, decode instructions, and generate status to indicate opcode fetches and other similar cycles. The state machine does this by decoding each instruction. It then follows a sequence of states for that instruction that identify each cycle and when the next opcode occurs.

The state machine is composed of a nine bit state register (U3G and half of U1G) and three 512 x 8 bit PROMs. U2G and the lowest bit of U2H give the next state value. The remainder of U2H is several control lines for the state machine. U2F produces status about the current states.

Latches U3D and U3E hold opcodes and other code bytes. When needed, the output of latch U3D or U3E is enabled and input to U3F (2K x 8 bit PROM). This PROM decodes the data value and produces a five bit code. The code is used as the lower five bits of the next state and gives a 32 way branch capability.

The state machine advances one state for each bus cycle the processor executed in instruction. When the processor stops executing instructions, as in a halt/bus grant, the state machine stops also. This is controlled by PCLOCK.

GENERAL INFORMATION

The 64671A module contains circuitry required to interface the Logic Analyzer to the 6809 Microprocessor. The mainframe supplies +5 volts to this module for operating power at TTL logic levels. The 6809/6809E Interface Module ID code is 71 decimal.

INSTALLATION PROCEDURES

*** CAUTION ***

Remove Power from the System Before Preceding with the Installation

INSTALLATION IN MODEL 64650A GENERAL PURPOSE PREPROCESSOR

1. Connect W6 from the small General Purpose Preprocessor card (A2) to J4 on the 6809/6809E Interface Module.
2. Connect W3 from the large General Purpose Preprocessor card (A1) to J3 on the 6809/6809E Interface Module.
3. Lower the Interface Module into the Preprocessor so that the component side fits inside the pod.
4. Fit the Pod Cover hinges into hinge slots on the General Purpose Preprocessor pod. Lower the cover over the Interface Module and fasten down with screws.

*** CAUTION ***

To avoid possible damage from static discharge, always connect the wire assembly (W4) from the preprocessor end cap to J5 on the 6809/6809E Interface Module.

INSTALLATION IN MODEL 10269A INTERFACE (for 1630A/D/W).

1. Connect W1 from J4 on the General Purpose Interface Card in the 10269A to J4 on the Dedicated Interface Module.
2. Connect W2 from J3 on the General Purpose Interface card in the 10269A to J3 on the Dedicated Interface Module.
3. Fit the Dedicated Interface Module assembly into hinge slots on the 10269A General Purpose Probe Interface Pod. Lower the cover and fasten down with screws.

INTERFACE REQUIREMENTS.

The 64671A Interface Module will operate with an 6809/6809E Microprocessor clocked at rates up to 2 MHz. The card adds one ALS TTL load to all monitored lines and an interface capacitance of approximately 35 pF.

PERFORMANCE VERIFICATION AND ADJUSTMENT PROCEDURE

Equipment Needed (or Equivalent)

Logic Probe.....	HP 10525T
Logic Pulser.....	HP 10526T

There are no automatic performance tests and no adjustments for the Model 64671A.

TROUBLESHOOTING

If a failure is suspected in the HP 64671A Interface Module, troubleshooting can be done using a Logic Pulser and a Logic Probe. The Model 64671A must be connected to the Model 64650A or the Model 10269A. Remove the ZIF connector from the system under test. Remove the 6809/6809E Microprocessor from the ZIF connector. Pulse each pin of the ZIF socket, and, using the schematic, look for a pulse on the appropriate pin of J3 and J4.

Figure 2. Replaceable Parts Breakdown

NOTICE

CONDUCTIVE FOAM OR PLASTIC OVER EMULATOR PINS MAY CAUSE ERRATIC OPERATION.

The emulator and preprocessor user probe assembly pins are covered at the time of shipment with either a conductive foam wafer or a conductive plastic pin protector. This is done for two reasons: 1) to protect the user interface circuitry within the emulator or preprocessor from electro-static discharge (ESD), 2) to protect the delicate gold plated pins of the probe assembly from damage due to impact.

Both the foam and plastic protection devices are conductive. This may cause erratic performance of the emulation or analysis system during operation and also during option__test performance verification. Therefore, it is recommended that the foam or plastic device be removed before using the emulation or analysis system or before running option__test performance verification.

When not using the emulator or preprocessor, the foam or plastic assembly should be replaced to retain protection for the probe pins and protection from ESD.

READER COMMENT SHEET

Part Number: 64671-90901

Your comments are important to us. Please answer this questionnaire and return it to us. Circle the number that best describes your answer in questions 1 through 7. Thank you.

1. The information in this book is complete:

Doesn't cover enough
(what more do you need?)

1 2 3 4 5

Covers everything

2. The information in this book is accurate:

Too many errors

1 2 3 4 5

Exactly right

3. The information in this book is easy to find:

I can't find things I need

1 2 3 4 5

I can find info quickly

4. The Index and Table of Contents are useful:

Helpful

1 2 3 4 5

Missing or inadequate

5. What about the "how-to" procedures and examples:

No help

1 2 3 4 5

Very helpful

Too many now

1 2 3 4 5

I'd like more

6. What about the writing style:

Confusing

1 2 3 4 5

Clear

7. What about organization of the book:

Poor order

1 2 3 4 5

Good order

8. What about the size of the book:

too big/small

1 2 3 4 5

Right size
